

PROJECT DESIGN PHASE

Solution Architecture

Date	06 September 2026	Name	B Santoshi
Project Name	Incident Lifecycle Automation in ServiceNow	Maximum Marks	4 Marks

Solution Architecture:

The proposed architecture bridges the incident-management business problem and the ServiceNow technology solution. It defines the structure, behavior, workflow, integrations, and delivery requirements needed to automate the complete Incident Management lifecycle.

Architecture Goals

- Find asuitable technology solution for structured incident handling and faster resolution.
- Describe the structure, characteristics, and behavior of the ServiceNow Incident workflowfor project stakeholders.
- Define features and requirements for creation, classification, assignment, investigation, resolution, change handling, child incidents, and knowledge reuse.
- Provide specifications for managing incidents, SLAs, escalations, and service visibility.

Incident Lifecycle Automation in ServiceNow — Solution Architecture

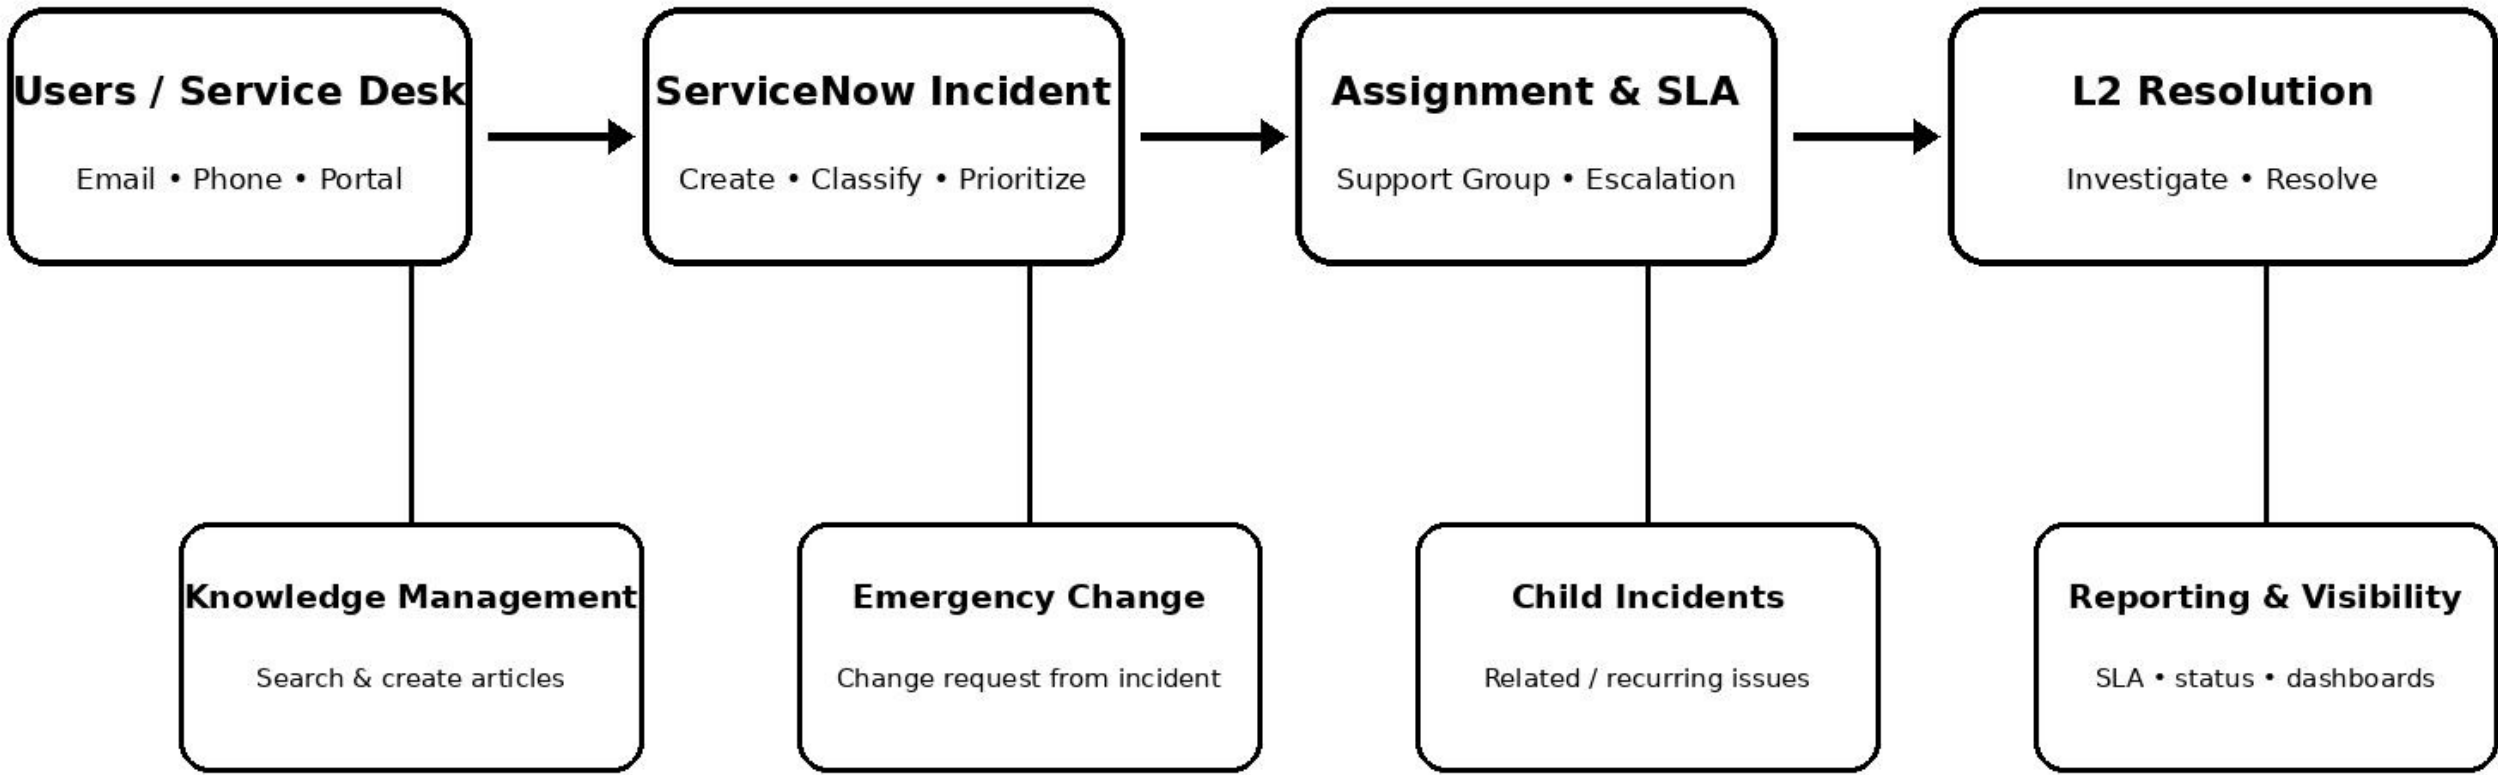

Figure 1: Proposed ServiceNow architecture and incident data flow

Figure 1: Proposed ServiceNow architecture and incident data flow

Architecture Components&Flow

- Incident Intake: Service Desk creates the incident and captures required details.
- Incident Management: Classification and prioritization establish the correct handling path.
- Assignment & SLA: Incidents are routed to the appropriate support group with SLA tracking and escalation.
- L2 Support: Level 2 technicians investigate, document work, and resolve the incident.
- Connected Capabilities: Knowledge Management supports faster resolution; emergency change requests and child incidents are created when required.
- Knowledge & Reporting: Resolved incidents can generate reusable knowledge, while status and SLA reporting improve service visibility.
